*PET* Aug 01 2020 This book is written as both a text and a reference book. It contains numerous images from the biological sciences and clinical practice, tables, graphs, and figures, as well as exercises that are worked out to aid the reader in understanding principles or solving problems. In some cases, derivations are placed in appendices so as not to break up the flow of the subject matter in the text. The book is intended for a broad audience interested in molecular imaging with positron emission tomography

(PET). It is expected that the readers will range from undergraduate, graduate, and medical students to residents, physicians, and scientists with backgrounds from various physical, biological, and medical specialty areas. Each chapter presents material in a straightforward manner that is well illustrated and explained. Because of the diverse audience for the book, certain chapters or sections of chapters will be of more interest than others to certain segments of the readership. Chapter 1 introduces the fundamental physics upon which PET imaging systems is based and discusses in detail the technologies and methods

used to produce PET images. The chapter starts out by reviewing the physics of positron emission and annihilation and explains how positron range and photon non-collinearity in coincidence detection place certain limits on spatial resolution.

### **RadTool Nuclear Medicine**

**MCQs** Apr 21 2022 This book, in MCQ format, is a comprehensive tool that will help Nuclear Medicine and Radiology residents and attending physicians to understand concepts in nuclear medicine. Questions cover clinical applications of nuclear medicine techniques to the cardiovascular, pulmonary, endocrine, skeletal, gastrointestinal, genitourinary, and central nervous systems. In addition, topics in physics, radiopharmacy, and radiation safety are addressed. The MCQ format closely resembles that used in board examinations in

nuclear medicine. Each question has four possible answers, only one of which is correct. About 60% of the questions are linked to clinical cases, with each case having four questions on average, along with one or two images. The remainder of the questions are free-standing, with or without an image. Answers are concise but are supported by references to the literature when necessary. Pearls in boxes are used to highlight the most important pieces of information. While the questions are scrambled, as in board exams, an index categorizes each question into one of the systems or topics.

**Clinical Nuclear Medicine**

## **Neuroimaging** Oct 27 2022

This book serves as a casebook for clinical nuclear medicine neuroimaging. Clinical interpretation of nuclear medicine neuroimaging studies is often challenging, mainly due to the complexity of neuroanatomy and a lack of supportive reference books. This is an unmet need in many teaching hospitals. Utilizing a hands-on, case-based approach, this textbook guides readers through clinical nuclear medicine neuroimaging of major neurological diseases and conditions, including dementia, epilepsy, and brain death. Included here are basic guidelines and techniques for nuclear medicine neuroimaging

practices, set alongside case examples that include standardized imaging display and detailed interpretation. Each chapter begins with examples of normal brain imaging as a reference point for the remainder of the chapter, which then presents detailed case examples of these diseases through various imaging techniques. Each of the cases highlights clinical and imaging key findings and precise impressions. This is an ideal guide for residents, fellows, and even practicing nuclear medicine physicians as a reference and teaching tool for neuroimaging in clinical nuclear medicine. It will be of significant value to residents,

trainees, and young physicians in preparation for their in-service tests and board examinations.
